4. ABBOTT LABORATORIES RESEARCH DEP TMENT

PROJECT
EXP. OR CODE NO.
There have been recent indications that HCV
core proleins can be dedested in serum at
HEV infected individuals, most notably the
sublications from Tonen comporeration (Tangka
et al Jonard of Herabology 1995 33: 7242 -745, and Agyagi et al., in the Dovernal
-745, and Aoyagi et al, in the Tovernol
1 (Imrial Microbiology 1999 37:1802-1808.
of Chrisal Microbiology 1999 37:1802-1808. Threre have been no published discoloures
per suring to an antizen/ antibody combs test
for detection of exposure to HCV to date.
There are several possible methods for devising
a combo HTV test allowing detection of
both antibodies and antigens associated with
ou sure to How. Current an tighus tauts
for the antibody test include recording
I was proteins dervied from several different
open reading frames of the works undusting
core + envelope protein as well as problems
from non structual regions designated as
NS (mostructual) 2, NS, NSy and NSS.
Commercial Ted feets currently utilize
HCV proteins from PSz nSy and/a NS5.

ABBUIL LABURATURIES RESEARC DEPARTMENT

PROJECT HCL antyu deit
EXP. OR CODE NO.
A potential combs fest would continue to
Hitizo and or more vitally derived profins
from HCV for antibody detector but invaled
also empley antibodies generaled against
HCL proteins to develop an antigh sandwith
assay which capture HCL proteins on a
solid phase (nitrocllular, microparticles, polytyrene
plates or bend) and then firther detects the
captured postern with a labelled antibody.
One of the most likely targets for detection
af Hel antigue is the Hel core postein.
White Tonen corporation has clearly
demastrated utility of an HOV antyle
fest, there has been no clean indication
of a contro test being developed.
Fa this reason, the following proposed is
made - Abbit Loss would develop an
antiboly /antigen combo Hest allowing
similtaneous detection of autiliadas &
antigen asserated with exposue to Hel-
In one example of His contra assay a
sold phase would be costed with the
potein (NS3, NS4 and fragments of the HCV
Come apple of come also contest with antinodis
Little (continued in page 6)
core poten) and also control with antiordis from HCV. (control on page 6) SIGNATURE DATE

PROJECT HOU ANTHU LIST
EXP. OR CODE NO.
This solid phone world corpture antibadies
to HOV or world also couptine HOV proteins
(e.g. Core protein). the captured antisosius
That were captured due to antibodies bonding to
Lieu proteins would be recognised by a
sound antibody (e.g. goat anti-human Iga)
that is labelled with a reporter molecule,
Chargeradish peroxide, acridinion, biolin ltd.
allowing detection of antibodies directed agost
the gold phase hound proteins derived from HOV.
the captured antighas would be vergos and
in one example of the cours assay by
speritie antisties (e-51 moderal autisallis)
against the one problem. This splanger
antisdy world be labeled with a reporter
molecule (horgeralish peroxidue biotin acridiaium)
to allow detection of the Borns antight
One of the important differences between
the contra test for the and the as
proposed here is that are continue to
be able to detect antibodis to core and
core antizers at the same time. In order
to do this successfully, the one portion
neds to be re-engineered. He page !
